

What is OneApp?

OneApp is an innovative healthcare technology solution developed specifically for Jersey. It is designed to address the unique challenges posed by an aging population and the increasing demands on our healthcare system. OneApp has been created *in Jersey, for Jersey residents*, to provide practical and personalised healthcare management solutions.

Why OneApp?

OneApp is a comprehensive, lifelong personal care record available on mobile devices. It allows users, healthcare professionals, and systems—including doctors, nurses, pharmacists, electronic health record systems, and wearable devices—to input data seamlessly.

The app automatically analyses incoming data, interprets it, and brings it to life by creating unique, evidence-based personal care pathways tailored to each individual. These pathways deliver personalised, interactive alerts, reminders, and follow-up actions, helping users achieve optimal health outcomes.

OneApp supports multiple languages and includes features for well-being programs, health promotion, and informational resources, empowering individuals to take charge of their self-care and manage their health independently when appropriate.

By guiding individuals toward their best health outcomes, **OneApp** delivers value not only to users but also to funders, insurers, providers, and employers by reducing costs and improving overall health management efficiency

OneApp Soft Launch Plan

We will collaborate with the **Diabetes Jersey charity** to identify patients for onboarding. The charity will send invitations to patients for a **morning breakfast event**, sponsored by **ESH Solutions Limited**.

During the event, we will demonstrate OneApp's features, particularly its ability to create **personalised care pathways** for individual patients.

We have onboarded **Nathan Wright** to our team. Nathan, a Type 1 diabetic patient, will assist with the onboarding process. His insights and feedback will be invaluable in refining the app for end users.
